Aerial Advantages with ACLF.

Low Salt Indexes -

Making it safe for the crop, the environment and the equipment applying it.

Low Application Rates

With the improved efficiency of Agro-Culture Liquid Fertilizers combined with the foliar application, superior crop response may be achieved with less material.

Application Flexibility

With the low volume application rates combined with the Low Salt Index and compatibility with most herbicides, aerial applicators have opportunity to provide an economical advantage to the grower.

"Responsible Nutrient Management"

HighNRG-N™ for Top-dress on wheat with Aerial Applicators has been a time tested and proven way to increase yields. Whether the need is for additional Nitrogen or in combination with a herbicide program, low volume application with reduced burn potential creates an economical advantage for the Aerial Applicator.

HighNRG-NR™ is a new balance of Nitrogen for the grower providing one of the industries lowest salt indexes providing little risk of burn to the growing crop. For the grower that is looking for a late application of Nitrogen to the maturing corn crop, this is the answer. High NRG N-R™ is designed for greater absorption through the leaf for a rapid nitrogen response from a low application rate.

Ferti-Dain™ is a proven foliar product for many crops, maximizing yield potential and improving plant health. From increasing pod set on soybeans to finishing bolls on cotton, the applications of this product are numerous. When combined with other ACLF products you can be assured that you achieve the maximum potential for each crop.

Sure-K™ Whether applied alone, with other ACLF products, or in combination with herbicides, Sure-K™ is a highly available form of Potassium perfect for foliar application. Low application volumes with maximum crop safety makes Sure-K™ a perfect choice for aerial applicators.
